STABLE MIXTURES CONTAINING OPACIFYING PIGMENTS

CROSS REFERENCE TO RELATED APPLICATIONS

This application claims priority to U.S. Provisional Applications Ser. Nos. 60/183,655 filed February 18, 2000, 60/183,656 filed February 18, 2000, and 60/247,639 filed November 10, 2000.

BACKGROUND OF THE INVENTION

Field of the Invention

This invention is related to stable mixtures containing opacifying pigments and more specifically, to stable mixtures containing select combinations and levels of titanium dioxide, a thickener, and a dispersant for use in making paint and other end products.

Description of Related Art

In co-pending U.S. provisional patent applications Serial Nos. 60/183,655; 60/183,656; and 60/247,639; prepaints and a method of making paints from these prepaints is described. One of the prepaints is a mixture comprising at least one opacifying pigment, typically titanium dioxide. The other two prepaints may contain either an extender pigment or/and an emulsion polymeric binder. A key requirement for the prepaints is their compatibility with one another so that they may be mixed with each other in various ratios to make at least one paint line. Another key requirement is that the prepaints, whether comprising an opacifying pigment, an extender pigment, or an emulsion polymeric binder, be stable so that the prepaints may be prepared, shipped, and stored without failing, for example, failure by exhibiting non-homogeneity, syneresis, settling, gelling and/or viscosity changes.

With respect to prepaints containing an opacifying pigment, stability can be a serious problem. This is especially true when one considers that even the best commercially-available titanium dioxide slurries show some syneresis (>2% by volume by visual inspection) upon storage and must be stirred vigorously and for a considerable length of time before use.

Hence, there is a need for stable mixtures containing specific combinations and levels of titanium dioxide, thickeners, and dispersants that may be employed, *inter alia*, as prepaints in a method of making paints or as conventional components in other end-use where opacifying pigments are employed, including coatings, impregnants, inks, graphic arts, papers, textiles, caulks, mastics, adhesives, sealants, building products and leather.

SUMMARY OF THE INVENTION

Various fluid opacifying mixtures based on titanium dioxide are provided. Some of the mixture are stable and no mixing is required, others are stable with occasional mixing required, and others are stable with constant mixing required.

As used herein for all the mixtures "lbs/100 gallons" is based on the weight of the dry material, unless otherwise noted.

The following mixtures are stable and require no mixing when formulated as described below.

Mixture 1 is a fluid opacifying pigment mixture comprising:

- (a) about 600 to about 1500 lbs/100 gallons of at least one universal-grade titanium dioxide;
- (b) about 0.2 to about 20 lbs/100 gallons of at least one hydrophobically-modified ethylene oxide-urethane polymer (HEUR) thickener selected from the group consisting of:
 - (i) a HEUR having a C₄-C₁₂ hydrophobe and a molecular weight of about 10,000 to about 200,000;
 - (ii) a HEUR having a C₆-C₃₀ hydrophobe and a molecular weight of about 10,000 to about 200,000; and
 - (iii) combinations thereof; and
- (c) about 1.5 to about 16 lbs/100 gallons of at least one dispersant selected from the group consisting of a maleic acid/diisobutylene copolymer, a butylmethacrylate/methacrylic acid copolymer, and an acrylic acid – hydroxypropyl acrylate copolymer;

Mixture 2 is a fluid opacifying pigment mixture comprising:

- (a) about 600 to about 1500 lbs/100 gallons of at least one interior-grade titanium dioxide;
- (b) about 0.3 to about 5 lbs/100 gallons of at least one hydrophobically-modified, alkali-soluble or alkali-swelling emulsion (HASE) thickener having a C₆-C₂₂ hydrophobe and a molecular weight of about 10,000 to about 7,000,000; and
- (c) about 1.8 to about 23 lbs/100 gallons of at least one dispersant selected from the group consisting of maleic acid/diisobutylene copolymer, a butylmethacrylate/methacrylic acid copolymer, and an acrylic acid – hydroxypropyl acrylate copolymer;

Mixture 3 is a fluid opacifying pigment mixture comprising:

- (a) about 600 to about 1500 lbs/100 gallons of at least one interior-grade titanium dioxide;
- (b) about 0.5 to about 3 lbs/100 gallons of at least one hydroxyalkyl cellulose thickener having a molecular weight of about 10,000 to about 10,000,000; and
- (c) about 1.8 to about 23 lbs/100 gallons of at least one polyacrylic acid dispersant.

Mixture 4 is a fluid opacifying pigment mixture comprising:

- (a) about 600 to about 1500 lbs/100 gallons of at least one universal-grade titanium dioxide;
- (b) about 2 to about 6 lbs/100 gallons of at least one hydrophobically-modified hydroxyalkyl cellulose thickener having a molecular weight of about 10,000 to about 10,000,000; and
- (c) about 1.8 to about 23 lbs/100 gallons of at least one polyacrylic acid dispersant.

Mixture 5 is a fluid opacifying pigment mixture containing:

- (a) about 600 to about 1500 lbs/100 gallons of at least one universal-grade titanium dioxide;
- (b) about 0.2 to about 10 lbs/100 gallons of at least one hydrophobically-modified hydroxyalkyl cellulose thickener having a molecular weight of about 10,000 to about 10,000,000;
- (c) about 2 to about 10 lbs/100 gallons of at least one hydrophobically-modified ethylene oxide urethane polymer (HEUR) thickener having a C₄-C₃₀ hydrophobe and a molecular weight of about 10,000 to about 200,000; and
- (d) about 3.0 to about 22.5 lbs/100 gallons of at least one maleic acid/diisobutylene copolymer dispersant.

Mixture 6 is a fluid opacifying pigment mixture comprising:

- (a) about 600 to about 1500 lbs/100 gallons of at least one universal-grade titanium dioxide;
- (b) about 0.2 to about 10 lbs/100 gallons of at least one hydrophobically-modified hydroxyalkyl cellulose thickener having a molecular weight of about 10,000 to about 10,000,000;
- (c) about 2 to about 10 lbs/100 gallons of at least one hydrophobically-modified ethylene oxide urethane polymer (HEUR) thickener having a C₄-C₃₀ hydrophobe and a molecular weight of about 10,000 to about 200,000; and
- (d) about 0.5 to about 22.5 lbs/100 gallons of at least one acrylic acid – hydroxypropyl acrylate dispersant.

The following mixtures are stable with occasional mixing required.

Mixture 7 is a fluid opacifying pigment mixture comprising:

- (a) about 600 to about 1500 lbs/100 gallons of at least one universal-grade titanium dioxide;
- (b) about 1 to about 10 lbs/100 gallons of at least one hydroxyalkyl cellulose thickener having a molecular weight of about 10,000 to about 10,000,000 or hydrophobically-modified hydroxyalkyl cellulose thickener having a molecular weight of about 10,000 to about 10,000,000;
- (c) optionally, about 2 to about 12 lbs/100 gallons of at least one hydrophobically-modified ethylene oxide urethane polymer (HEUR) thickener having a C₄-C₃₀ hydrophobe and a molecular weight of about 10,000 to about 200,000 or at least one clay thickener; and

- (d) about 0.5 to about 22.5 lbs/100 gallons of at least one acrylic acid/hydroxyl propyl acrylate dispersant.

Mixture 8 is a fluid opacifying pigment mixture containing:

- (a) about 600 to about 1500 lbs/100 gallons of at least one universal-grade titanium dioxide;
- (b) about 0.3 to about 5 lbs/100 gallons of at least one hydrophobically-modified, alkali-soluble or alkali-swellaable emulsion (HASE) thickener having a C₆-C₂₂ hydrophobe and a molecular weight of about 10,000 to about 7,000,000; and
- (c) about 1.2 to about 45 lbs/100 gallons of at least one polyacrylic acid dispersant;

The following mixtures are stable with constant mixing required. They are formulated as described below.

Mixture 9 is a fluid opacifying pigment mixture containing:

- (a) about 600 to about 1500 lbs/100 gallons of at least one universal-grade titanium dioxide;
- (b) about 0.5 to about 10 lbs/100 gallons of at least one hydroxyalkyl cellulose thickener having a molecular weight of about 10,000 to about 10,000,000 or about 0.5 to about 10 lbs/100 gallons of a hydrophobically-modified hydroxyalkyl cellulose thickener having a molecular weight of about 10,000 to about 10,000,000; and
- (c) about 1.2 to about 18 lbs/100 gallons of at least one maleic acid/diisobutylene dispersant.

Mixture 10 is a fluid opacifying pigment mixture containing:

- (a) about 600 to about 1500 lbs/100 gallons of at least one universal-grade titanium dioxide;
- (b) about 0.1 to about 3 lbs/100 gallons of at least one hydrophobically-modified, alkali-soluble or alkali-swellaable emulsion (HASE) thickener having a C₆-C₂₂ hydrophobe and a molecular weight of about 10,000 to about 7,000,000; and
- (c) about 0.6 to about 22.5 lbs/100 gallons of at least one acrylic acid/ hydroxyl propyl acrylate dispersant.

Mixture 11 is a fluid opacifying pigment mixture containing:

- (a) about 600 to about 1500 lbs/100 gallons of at least one universal-grade titanium dioxide;
- (b) about 0.1 to about 3 lbs/100 gallons of at least one hydrophobically-modified, alkali-soluble or alkali-swellaable emulsion (HASE) thickener having a C₆-C₂₂ hydrophobe and a molecular weight of about 10,000 to about 7,000,000; and
- (c) about 0.6 to about 45 lbs/100 gallons of at least one maleic acid/diisobutylene dispersant.

Mixture 12 is a fluid opacifying pigment mixture containing:

- (a) about 600 to about 1500 lbs/100 gallons of at least one interior-grade titanium dioxide;
- (b) about 0.2 to about 20 lbs/100 gallons of at least one hydrophobically-modified ethylene oxide urethane polymer (HEUR) thickener selected from the group consisting of:

- (i) a HEUR having a C₄-C₁₂ hydrophobe and a molecular weight of about 10,000 to about 200,000;
 - (ii) a HEUR having a C₆-C₃₀ hydrophobe and a molecular weight of about 10,000 to about 200,000; and
 - (iii) combinations thereof; and
- (c) about 1.2 to about 8 lbs/100 gallons of at least one maleic acid/diisobutylene dispersant.

All of the above mixtures have a titanium dioxide (TiO₂) pigment volume concentration (PVC) of about 40 to 100%, a titanium dioxide (TiO₂) volume solids content of at least about 15%, and a Stormer viscosity of about 50 to about 250 KU.

All of the mixtures contain water and may contain optional additives selected from the group consisting of a defoamer, a surfactant, a coalescent, a base, a biocide, a mildewcide, a co-dispersant, a polymeric binder, a voided latex polymer and combinations thereof.

In order to prepare stable mixtures of opacifying pigments, one must follow strict rules in selecting the types and level of specific ingredients, using the general approach set out below:

select the type and level of titanium dioxide based on whether the final paint will be for exterior or interior use with a universal-grade being selected for interior, exterior, or interior/exterior use and with an interior-grade being selected for interior use only;

select the appropriate rheology modifier/thickener based on the type of titanium dioxide selected;

select the appropriate dispersant based on the type of rheology modifier/thickener selected;

determine the level of dispersant necessary to produce a stable final mixture; and

determine the level of rheology modifier/thickener required to produce a stable final mixture.

As used herein, the term “stable” applies to those mixtures that meet all of the following criteria, as set out in the Stability Tests described below, after being stored at a temperature of at least 120°C for at least ten (10) days:

(1) there is less than 2% by volume of syneresis in the mixture (determined by inspecting the pigment mixture visually) (referred to herein as “Stability Test 1”).

(2) the mixture has a Brookfield viscosity (measured at a shear rate of 1.25 sec⁻¹) of less than 100,000 centipoise, preferably less than 50,000 centipoise after cooling to ambient temperature (22-25°C), but prior to mechanical shearing (referred to herein as “Stability Test 2”).

(3) the ratio of the Brookfield viscosity (measured at a shear rate of 1.25 sec⁻¹) after heat aging to the Brookfield viscosity (measured at a shear rate of 1.25 sec⁻¹) prior to heat aging is

no greater than 3 after the mixture is cooled to ambient temperature (22-25°C) and after mechanical shearing using a propeller-type mixer (referred to herein as "Stability Test 3"). Commercial titanium dioxide slurries do not pass Stability Test 1 and must be stirred, sometimes constantly, prior to use. Mixtures having Brookfield viscosities higher than those specified in Stability Test 2 tend to gel and resist flow and therefore are difficult to pump in conventional equipment. Stability Test 3 is used to determine whether or not the mixture developed, or will develop, a gel network resistant to shear thinning (mixing) during storage.

The mixing conditions used to categorize the stability of the fluid opacifying pigment mixtures are as follows:

- (1) mixtures which require no mixing or other form of agitation over typical storage times (at least 30 days) and under storage conditions where the temperature can be as high as 140°F and as low as 25°F to remain stable are referred to herein as "stable with no mixing required" (require mixing over 0% of storage time);
- (2) mixtures which require periodic or occasional mixing or other forms of agitation to re-homogenize or break any minimal or slight structure formed over the typical storage times and conditions described above are referred to herein as "stable with occasional mixing required" (require mixing over >0% of storage time); and
- (3) mixtures which require constant mixing or other forms of agitation to re-homogenize or break any significant structure formed over the typical storage times and conditions described above (are referred to herein as "stable with constant mixing required" (require mixing over >50% of storage time).

It should be noted that while the "stable with no mixing required" condition requires no mixing or other form of agitation to remain stable, applying some form of mixing or agitation to the mixture (whether occasional or constant) does not exclude that particular mixture from the definition of a stable mixture with "no mixing required". Likewise, it should be noted that while the "stable with occasional mixing required" condition requires only occasional mixing or other form of agitation to remain stable, applying constant mixing or agitation to the mixture does not exclude that particular mixture from the definition of a stable mixture with "occasional mixing required".

Any type of mixer or agitator may be used such as, but not limited to an impellar, a recirculator, a shaker, a mill, a rotator, a bubbler, a sonicator, a pump or a like means suitable to move the mixture about itself.

The mixtures herein may be employed as prepaints in systems using delayed product differentiation as described in U.S. Patent Applications Serial Nos. 60/183,655 filed February 18,

2000; 60/183,656 filed February 18, 2000; 60/247,639 filed November 10, 2000], as well as employed as replacements for conventional mixtures containing opacifying pigments, such as titanium dioxide slurries, mill bases, colorant dispersions, coating colors, and the like.

The pigment volume concentration (PVC) is a measure of how “binder-rich” a formulation is. It is calculated using the formula:

$$\text{PVC (\%)} = \frac{(\text{volume of pigment(s)} + \text{volume extender(s)})}{(\text{volume of pigment(s)} + \text{volume extender(s)} + \text{volume binder(s)})} \times 100$$

The volume solids content (VS) is the dry volume of pigment(s) plus the dry volume of extender(s) plus the dry volume of binder(s). It is calculated using the formula:

$$\text{VS (\%)} = \frac{\text{dry volume of pigment(s)} + \text{dry volume of extender(s)} + \text{dry volume of binder(s)}}{\text{total volume of formulation}} \times 100.$$

If additives are present, their volume is not included in determining the total dry volume.

The titanium dioxide pigment volume concentration (TiO₂ PVC) is a measure of how “binder-rich” a formulation is relative to only the titanium dioxide (TiO₂) content. It is calculated using the formula:

$$\text{TiO}_2 \text{ PVC (\%)} = \frac{\text{volume of TiO}_2 \text{ pigment(s)}}{(\text{volume of pigment(s)} + \text{volume extender(s)} + \text{volume binder(s)})} \times 100$$

The titanium dioxide volume solids content (TiO₂ VS) is the dry volume of TiO₂ pigment(s) plus the dry volume of extender(s) plus the dry volume of binder(s). It is calculated using the formula:

$$\text{TiO}_2 \text{ VS (\%)} = \frac{\text{dry volume of TiO}_2 \text{ pigment(s)}}{\text{total volume of formulation}} \times 100.$$

If additives are present, their volume is not included in determining the total dry volume.

Opacifying Pigments

Suitable opacifying pigments include:

- (1) white pigments which impart white scattering power to a paint across all visible wave lengths without a high degree of absorption; and
- (2) auxiliary hiding pigments including inorganic and organic solids or voided latex polymers which do not impart a primary color or hiding power to a paint although they may have secondary influences on those properties.

Such opacifying pigments include titanium dioxide or a combination of titanium dioxide and auxiliary hiding pigments such as voided latex polymer particles, zinc oxide, lead oxide, a synthetic polymer pigment, and mixtures thereof. Rutile and anatase grades of titanium dioxide are suitable for use herein. Rutile titanium dioxide is preferred. The surface of the titanium

dioxide may be treated with various organic or inorganic surface treatments, *e.g.*, the oxides of silica, alumina, and zirconia. Fumed titanium oxide is also useful herein.

For specific mixtures, certain grades of titanium dioxide are required. For example, for some of the mixtures universal-grade titanium dioxide may be used, whereas for others interior-grade titanium dioxide must be used. As used herein, "universal-grade" titanium dioxide means titanium dioxide that is suitable for use in both interior and exterior applications and which is typically treated with oxides of alumina (about 1 to about 7%), silica (up to about 15%) and zirconia (up to about 15%). As used herein, "interior-grade" titanium dioxide means titanium dioxide that is only suitable for use in interior applications which is typically treated with only the oxides of alumina (about 1 to about 7%) or a combinations of the oxides of alumina (about 1 to about 7%) with the oxides of silica (up to about 5%). This grade of titanium dioxide is likely to provide poorer water resistance in final coatings than the universal-grade titanium dioxide).

The voided latex particles useful herein have a particle size diameter of about 100 nm to about 2,500 nm and a void fraction of about 10% to about 75%. Preferably, the particles have a particle size of about 500 nm to about 1,100 nm. The particles must have at least one void, but they may have multiple voids, non-spherical voids, interconnected voids, voids having channels connected to the outside of the particles, and they can encompass structures described as vesiculated and sponge-like. Preferably, the particles have a single void. They have a glass transition temperature (T_g), as measured by differential scanning calorimetry at a rate of 20°C/minute, of at least about 20°C, preferably at least about 50°C. The higher the T_g, the harder the particle is and the less likely it is to collapse. If the particles collapse, they are unable to contribute to hiding. The voided latex particles may be prepared by conventional polymerization processes known in the art, such as those disclosed in U.S. Patent Nos. 3,784,391, 4,427,836; 4,469,825; 4,594,363; 4,798,691; 4,880,842; 4,908,271; 4,972,000; 5,041,464, 5,157,084; 5,216,044, 5,494,971; 5,545,695; and 6,020,435, as well as Japanese Patent Applications 60/223,873, 61/62510, 61/66710, 61/86941, 62/127336, 62/156387, 01/185311, and 02/140272.

Thickener

Suitable thickeners include both non-associative, water-soluble/water-swellaable thickeners and associative thickeners. Suitable non-associative, water-soluble/water-swellaable thickeners include polyvinyl alcohol (PVA), alkali soluble or alkali swellaable emulsions known in the art as ASE emulsions, and cellulosic thickeners such as hydroxyalkyl celluloses including hydroxymethyl cellulose, hydroxyethyl cellulose and 2-hydroxypropyl cellulose, sodium carboxymethyl cellulose (SCMC), sodium carboxymethyl cellulose, 2-hydroxyethyl cellulose, 2-hydroxypropyl methyl cellulose, 2-hydroxyethyl methyl cellulose, 2-hydroxybutyl methyl

cellulose, 2-hydroxyethyl ethyl cellulose, and the like. Suitable associative thickeners include hydrophobically-modified, alkali-soluble emulsions known in the art as HASE emulsions, hydrophobically-modified ethylene oxide-urethane polymers known in the art as HEUR thickeners, hydrophobically-modified cellulose such as hydrophobically-modified hydroxyethyl cellulose, hydrophobically-modified polyacrylamides, and the like. Also useful as thickeners are fumed silica, attapulgite clay and other types of clay, titanate chelating agents, and the like.

Suitable dispersants include anionic polymers such as homopolymers and copolymers based on polycarboxylic acids, including those that have been hydrophobically- or hydrophilically-modified, *e.g.*, polyacrylic acid, polymethacrylic acid, maleic anhydride and copolymers thereof with each other and with various monomers such as styrene, acrylate or methacrylate, diisobutylene, and other hydrophilic or hydrophobic comonomers. Suitable dispersants further include salts of the above dispersants and mixtures thereof.

The opacifying mixtures may include certain optional additives including defoamers, surfactants, coalescents, biocides, mildewcides, co-dispersants, dispersing resins, latex adsorbing resins, polymeric binders, and the voided latex polymers (described above).

Suitable defoamers include silicone-based and mineral oil-based defoamers and the like.

Suitable surfactants include cationic, anionic and non-ionic surfactants.

Suitable coalescents, plasticizers, and other optional solvents include ethylene glycol, propylene glycol, hexylene glycol, 2,2,4-trimethyl-1,3-pentanediol monoisobutyrate (TEXANOLTM), glycol ethers, mineral spirits, methyl carbitol, butyl carbitol, phthalates, adipates, and the like.

Suitable mildewcides and biocides include zinc oxide, isothiazolones, triazoles, and the like.

Suitable co-dispersants include non-ionic, anionic, and cationic dispersants such as 2-amino 2-methyl 1-propanol, dimethyl amino ethanol, potassium tripolyphosphate, trisodium polyphosphate, citric acid and other carboxylic acids, and the like.

Latex polymer binders are polymers or prepolymers which form the primary film of a paint. They bind the pigment and/or extenders, provide the required paint flow, and determine the gloss and hardness of the final paint film. The binder selected will depend upon the final use of the formulated paints. Binders suitable for exterior paints are generally suitable for interior paints, but binders suitable for interior paints may not be suitable for exterior paints. Suitable binders include, but are not limited to, homopolymers, copolymers, or terpolymers such as, for example, polyvinyl acetate, styrene-acrylic, styrene-butadiene, vinyl acetate-acrylic, ethylene-vinyl acetate, vinyl acetate-vinyl versatate, vinyl acetate-vinyl maleate, vinyl acetate-vinyl

chloride-acrylic, ethylene-vinyl acetate-acrylic, and urethane polymers, optionally containing up to 10% by weight of functional groups (for example, but not limited to, carboxylic acid, phosphate, sulfate, sulfonate, amide and combinations thereof) other non-functional monomers, and mixtures thereof.

DETAILED DESCRIPTION OF THE INVENTION

All ranges disclosed herein are inclusive and the minimums and maximums of the nested ranges are combinable. All levels are in dry pounds/100 gallons i.e., pounds of solids/100 gallons of the mixtures unless otherwise noted. After the required ingredients and optional ingredients are combined, sufficient water is added to give a total of 100 gallons of the mixture.

The following optional ingredients may be included in any of the combination ranges shown below:

Optional Ingredients

Ingredient	Types	Preferred Types	Level	Preferred Level
Defoamer	any	solvent-based, silicone-based	1-5	2-3
Surfactant	nonionic, anionic, cationic	nonionic, anionic	1-7	1-5
Solvent and coalescent	propylene glycol, ethylene glycol, hexylene glycol, 2,2,4-trimethyl-1,3-pentanediol monoisobutyrate (Texanol®), butyl carbitol, methyl carbitol, mineral spirits,	propylene glycol, Texanol®	1-200	1-100
Base	ammonium hydroxide, sodium hydroxide, potassium hydroxide, 2-amino 2-methyl 1-propanol (AMP)	ammonium hydroxide, AMP-95	up to 10	up to 5
Biocide	isothiazolones, carbamates, thiazoles, phthalonitriles, dioxanes, hydantoins, carbanilides, triazines, ureas, thiocyanates	isothiazolones	up to 5	up to 3
Mildewcide	isothiazolones, carbamates, thiazoles, phthalonitriles, dioxanes, hydantoins, carbanilides, triazines, ureas, thiocyanates	isothiazolones	up to 20	up to 10
Co-dispersant	2-amino 2-methyl 1-propanol (AMP-95), dimethyl amino ethanol (DMEA), potassium tripolyphosphate (KTPP), trisodium polyphosphate (TSPP),	citric acid, KTPP, AMP	up to 5	up to 2
Polymeric Binder	See above description	vinyl acrylic, vinyl acetate, styrene acrylic	up to 150	up to 80
Voided latex polymer	See above description	x	up to 100	up to 60

Combination No. 1

The combinations shown below do not require mixing to remain stable. They are exemplified in Example 1.

Ingredients	Types	Preferred Types	Level	Preferred Level
Dispersant	MA/DIB, BMA/MAA, AA/HPA, SMA	MA/DIB	1.5-16	3.7-14
Thickener	HEUR effective hydrophobe C ₄ -C ₁₂ MW 10,000-200,000,	HEUR effective hydrophobe C ₄ -C ₁₂ and M W 12,000-150,000	0.2-20	10-16
	HEUR effective hydrophobe C ₆ -C ₃₀ MW 10,000-200,000, or combinations thereof	HEUR effective hydrophobe C ₆ -C ₂₄ and MW 12,000-150,000	0.8-5	0.2-2
TiO ₂	Universal grade coated with 1%-7% Al ₂ O ₃ , up to 15% SiO ₂ up to 15% ZrO ₂	Universal TiO ₂ coated with 1.5-5% Al ₂ O ₃ 1.2-12% SiO ₂ , up to 4% ZrO ₂	600-1500	700-1400

Combination No. 2

The following combinations do not require mixing to remain stable. They are exemplified in Example 2.

Ingredients	Types	Preferred Types	Level	Preferred Level
Dispersant	MA/DIB, BMA/MAA, AA/HPA, PAA	PAA	1.8-23	3.5-16.8
Thickener	HASE effective hydrophobe C ₆ -C ₂₂ MW 10,000-7,000,000	HASE effective hydrophobe C ₆ -C ₁₈ and MW 100,000-5,000,000	0.3-5	1-3
TiO ₂	Interior grade coated with 1-7% Al ₂ O ₃ / 0-5% SiO ₂ 0-5%	Interior grade coated with 2-5% Al ₂ O ₃ / 0-3% SiO ₂	600-1500	700-1400

Combination No. 3

The following combinations do not require mixing to remain stable. They are exemplified in Example 3.

Ingredients	Types	Preferred Types	Level	Preferred Level
Dispersant	PAA	PAA	1.8-23	3.5-16.8
Thickener	Hydroxyalkylcellulose and combinations thereof MW 10,000-10,000,000	Hydroxyethyl cellulose MW 100,000-2,000,000	0.5-3	1-2
TiO ₂	Interior grade coated with 1-7% Al ₂ O ₃ up to 5% SiO ₂	Interior grade coated with 2-5% Al ₂ O ₃ / up to 3%SiO ₂	600-1500	700-1400

Combination No. 4

The following combinations do not require mixing to remain stable. They are exemplified in Example 4.

Ingredients	Types	Preferred Types	Level	Preferred Level
Dispersant	PAA	PAA	1.8-23	3.5-16.8
Thickener	Hydrophobically-modified hydroxyalkylcellulose MW 10,000-10,000,000	Hydrophobically-modified hydroxyethylcellulose MW 50,000-2,000,000	2-6	3-5
TiO ₂	Universal coated with 1-7% Al ₂ O ₃ , up to 15% SiO ₂ , up to 15% ZrO ₂	Universal coated with 1.5-5% Al ₂ O ₃ , 1.2-12% SiO ₂ , up to 4% ZrO ₂	600-1500	700-1400

Combination No. 5

The following combinations do not require mixing to remain stable. They are exemplified in Example 5.

Ingredients	Types	Preferred Types	Level	Preferred Level
Dispersant	MA/DIB or AA/HPA	MA/DIB or AA/HPA	3.0-22.5 MA/DIB 0.5-22.5 AA/HPA	5.6-16.8 MA/DIB 2.8-14 AA/HPA
Thickener	Hydrophobically-modified hydroxyalkyl cellulose MW 10,000-10,000,000	Hydrophobically-modified hydroxyethyl cellulose MW 50,000-2,000,000	0.2-10	0.5-5
Thickener	HEUR effective hydrophobe C ₄ -C ₃₀ MW 10,000-200,000	HEUR effective hydrophobe C ₆ -C ₂₄ MW 12,000-150,000	2-10	5-10

Combination No. 10

The following combinations will require constant mixing to remain stable.

Ingredients	Types	Preferred Types	Level	Preferred Level
Dispersant	MA/DIB	MA/DIB	0.6-45	2.8-21
Thickener	HASE effective hydrophobe C ₆ -C ₂₂ MW 10,000- 7,000,000	HASE effective hydrophobe C ₆ -C ₁₈ MW 100,000- 5,000,000	0.1-3	0.3-2
TiO ₂	Universal coated with 1-7% Al ₂ O ₃ , up to 15% SiO ₂ , up to 15% ZrO ₂	Universal coated with 1.5-5% Al ₂ O ₃ , 1.2-12% SiO ₂ , up to 4% ZrO ₂	600-1500	700-1400

Combination No. 11

The following combinations require constant mixing to remain stable.

Ingredients	Types	Preferred Types	Level	Preferred Level
Dispersant	MA/DIB	MA/DIB	1.2-18	3.5 -14
Thickener	HEUR effective hydrophobe C ₄ -C ₁₂ MW 10,000-200,000 or HEUR effective hydrophobe C ₆ -C ₃₀ average MW 10,000- 200,000 or combinations thereof	HEUR effective hydrophobe C ₄ -C ₁₂ MW 12,000-150,000 HEUR effective hydrophobe C ₆ -C ₂₄ MW 12,000-150,000	0.2-20 0.8-5	10-16 0.2-2
TiO ₂	Interior grade coated with 1- 7% Al ₂ O ₃ , up to 5% SiO ₂	Interior grade coated with 2-5% Al ₂ O ₃ , up to 3% SiO ₂	600-1500	700-1400

Test Procedures

The Stormer viscosity of the mixtures is measured using ASTM method D562.

The Brookfield viscosity of the mixtures is measured using spindle #4 of a Brookfield viscometer at 6 rpm.

The ICI viscosity of the mixtures is measured using ASTM method D3205-77.

In the following examples, the mixtures may be prepared using a laboratory mixer having a 45° pitch stirring blade. The water and optional dispersant, defoamer, surfactant and/or biocide are combined and mixed. The titanium dioxide slurry is slowly added and the mixture is stirred for 15-20 minutes. The binder and optional coalescent, rheology modifier, ammonia, and additional water, if necessary, are then added.

In the above description and in the examples, the following abbreviations are used:

Abbreviations

AA	Acrylic acid
PAA	Polyacrylic acid
MA/DIB	Maleic acid/diisobutylene copolymer
AA/HPA	Acrylic acid/hydroxypropyl acid
BMA/MAA	Butylmethacrylate/methacrylic acid copolymer
SMA	Styrene or alpha methylstyrene/alkylacrylate (optional)/methacrylic or acrylic acid copolymers or terpolymers
HEC	Hydroxyethyl cellulose
HMHEC	Hydrophobically-modified HEC
HEUR	Hydrophobically-modified ethylene oxide-based urethane block copolymers
HASE	Hydrophically-modified alkali soluble emulsions
TiO ₂	Titanium dioxide
Al ₂ O ₃	Alumina or oxide of aluminum
SiO ₂	Silica or oxide of silicon
ZrO ₂	Zirconium dioxide
cps	centipoises
MW	molecular weight as measured by gel permeation chromatography

EXAMPLES

Example 1

Mixtures A to E described below will require no mixing to remain stable.

Ingredients	A
	lbs/100 gallons
<i>Grind prepared on Cowles disperser</i>	
Water	258.35
Propylene glycol	50
Tamol™ 731 MA/DIB dispersant	53.42
Foamaster® VL defoamer	1.50
Triton CF-10 surfactant	2.00
Kathon® LX 1.5% biocide	2.00
Ti-Pure® R706 universal-grade TiO ₂	1335.56
<i>Letdown prepared on Cowles disperser</i>	
Ammonia hydroxide (28%)	0.6
Foamaster® VL defoamer	1.50
Acrysol® RM-2020NPR HEUR thickener	30.00
<i>Letdown (on low speed mixer)</i>	
Acrysol® RM-2020NPR HEUR thickener	40.40
Water	68.96
KU initially after preparation	90
pH initially after preparation	9.20
ICI initially after preparation	2.8
Brookfield viscosity (cps at 1.25 sec ⁻¹)	2500
Actual scale prepared (gallons)	50

Foamaster® VL defoamer	1.87	1.87
Triton® CF-10 surfactant	2.50	2.50
Kathon®LX 1.5% biocide	2.50	2.50
Ti-Pure® R706 universal-grade TiO ₂	918.12	918.12
<i>Letdown prepared on Cowles disperser</i>		
Foamaster® VL defoamer	1.87	1.87
Ropaque® Ultra opaque polymer	205.53	205.53
<i>Letdown on a low speed mixer</i>		
Natrosol® Plus 330 (3% in solution in water) HMHEC thickener		45.09
Natrosol® 250 MHR (3.5% in solution in water) HEC thickener	127.69	45.09
Ammonium hydroxide (28%)	1.00	1.34
Water	0	80.99
KU initially after preparation	99	99
pH initially after preparation	8.69	8.76
ICI initially after preparation	1.6	0.8
Brookfield viscosity (cps at 1.25 sec ⁻¹)	20200	22700
Actual scale prepared (gallons)	100	100

Supplier Information

Material Name	Description	Supplier
Tamol™ 1124	Dispersant	Rohm and Haas Company (Philadelphia, PA)
Tamol™ 1254	Dispersant	Rohm and Haas Company (Philadelphia, PA)

Tamol™ 731	MA/GIB Dispersant	Rohm and Haas Company (Philadelphia, PA)
Acrysol™ DR-1	HASE Thickener	Rohm and Haas Company (Philadelphia, PA)
Acrysol™ DR-3	HASE Thickener/Rheology Modifier	Rohm and Haas Company (Philadelphia, PA)
Acrysol™ DR-73	HASE Thickener	Rohm and Haas Company (Philadelphia, PA)
Acrysol™ RM-2020 NPR	HEUR Thickener/Rheology Modifier	Rohm and Haas Company (Philadelphia, PA)
Rhoplex™ SG-10M	Emulsion Polymer Binder	Rohm and Haas Company (Philadelphia, PA)
RES 3083	Emulsion Polymer Binder	Rohm and Haas Company (Philadelphia, PA)
Kathon™ LX 1.5%	Biocide	Rohm and Haas Company (Philadelphia, PA)
Triton™ CF-10	Surfactant	Union Carbide Corporation (Danbury, CT)
Foamaster™ VL	Defoamer	Henkel Corporation (King of Prussia, PA)
Ti-Pure™ R-706	Titanium Dioxide	E.I. Dupont de Nemours and Co., Inc. (Wilmington, DE)
Ti-Pure™ R-900	Titanium Dioxide	E.I. Dupont de Nemours and Co., Inc. (Wilmington, DE)
Ti-Pure™ R-902	Titanium Dioxide	E.I. Dupont de Nemours and Co., Inc. (Wilmington, DE)
Kronas® 2102	Universal Grade Titanium Dioxide	Kronas (Houston, TX)
Ropaque®	Ultra Opaque Synthetic/Polymer	Rohm and Haas (Philadelphia, PA)
Texanol™	Coalescent	Eastman Chemical (Kings Port, TN)
Natrosol®	HEC Thickner	Hercules (Wilmington, DE)
Natrosol® Plus 430	HMHEC Thickener	Hercules (Wilmington, DE)
Natrosol® Plus 330	HMHEC Thickener	Hercules (Wilmington, DE)

Natrosol® 250 MHR
Attrigel® 50

HEC Thickener
Attapulgate Clay

Hercules (Wilmington, DE)
Engelhardt (Edison, NJ)
